

General information:

Serial interfaces enable digital communication with computers or higher ranking control systems. An RS 232 (optional USB) interface permits connection of one controller per computer interface. The RS485 interfaces enable the connection of max. 32 participants in one data bus. Here, the controllers must be set to different addresses for differentiation. (Controller configuration level). Several Interfaces upon request.

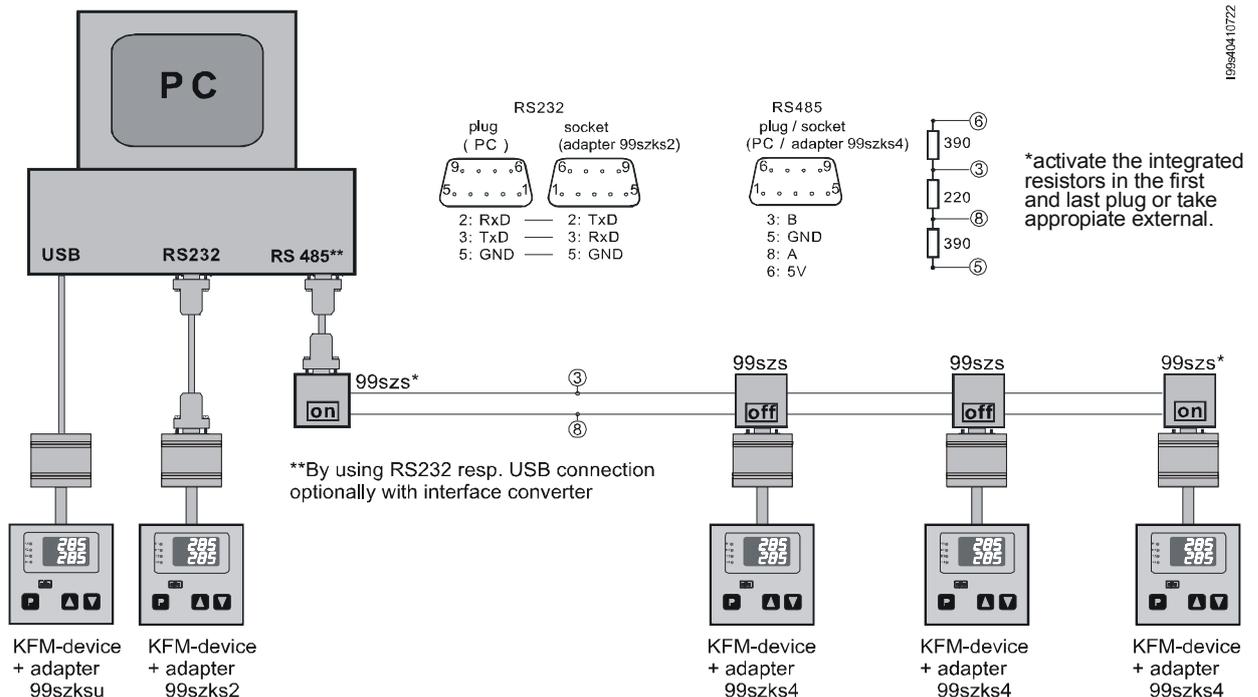

Technical data:

Interface:	direct connection - RS232, USB	bus connection - RS485
Connection:	serial, asynchronous 2 wire (+GND)	serial, asynchronous 2 wire (+GND)
Transfer medium:	twisted and screened cable	twisted and screened cable
Bus line length:	-	1000m
Branch connection length:	15m	2m
Max. number of controllers:	1	31
Transmission direction:	-	data flow control
Transfer rate:	9600, 19200, 38400 Bit / s	9600, 19200, 38400 Bit / s

Connection lines:

Cable junction for KFM devices is done by adapters which are linked to the service interface.
 By direct connection: RS232(99szks2), alternatively USB(99szksu)
 By bus connection: RS485(99szks4)
 To establish the bus connection, providing that there is no interface RS485 on PC resp. at the PLC existing, an interface converter RS232 resp. USB to RS485 is necessary.
 Use screened lines to connect the interfaces (e.g. KFM 99szl.).
 Place the screening on the controller earthing terminal.
 Connect the RS485 line at the beginning (PC or interface converter) and the end (last controller) with d- sub - plugs with integrated resistors (f.e. type 99szs) or appropriate external resistors.

Wiring example:

Transmission protocol:

Data is transmitted according to the KFM protocol 2.0 which is laid out in line with the ISO 1745.

Data format:

Each field of the data frame comprises a start bit, the 7 bit ASCII value, a parity bit for even parity and a stop bit.

Transmission rate: 9600, 19200 or 38400 Bit/s (depending on type resp. setting).

Data frame (telegram) :

The data frame commences and ends with a control character (see table) and comprises of 2 bytes for the controller address (ADR) and 4 bytes for the parameter code (code) as well as up to 6 bytes for the number value, i.e.: number value on the left from the decimal point: up to 4 bytes; 1 byte for the decimal point, number value on the right of the decimal point: 1 byte.
1 byte = 1 digit or letter or control character = 1 ASCII value

Data integrity:

The data frames for parameter transmission are safeguarded with a "BCC" sign, i.e.the transmitted data is supplemented by a check sum consisting of the logic linking (EXOR) of all transmitted characters between STX (excl.) and ETX (incl.).

The controller acknowledges a successful transmission with "ACK". A faulty transmission is confirmed by "NAK".

Examples: The computer requests data

EOT	ADR	ADR	Code	Code	Code	Code	ENQ
-----	-----	-----	------	------	------	------	-----

the controller response:

STX	Code	Code	Code	Code	=	val.	val.	val.	val.	val.	ETX	BCC
-----	------	------	------	------	---	------	------	------	------	------	-----	-----

The computer sends data. To this effect, the controller must be in operational state, because the simultaneous entry of data via interface and controller keyboard is inadmissible.

EOT	ADR	ADR	STX	Code	Code	Code	Code	=	val.	val.	val.	val.	val.	val.	ETX	BCC
-----	-----	-----	-----	------	------	------	------	---	------	------	------	------	------	------	-----	-----

controllers response to a successful transmission: ACK

controllers response to a faulty transmission: NAK

Control characters:

control characters	value(HEX)	meaning
STX	02	start of text
ETX	03	end of text
EOT	04	end of transmission
ENQ	05	enquire
ACK	06	acknowledge
NAK	15	not acknowledge
=	3D	value allocation

Permitted characters for code and value:

ASCII-code	value (HEX)	description	ASCII-Zeichen	value(HEX)	description
"0"	30	zero	"9"	39	nine
"1"	31	one	"A"	41	ten (code)
"2"	32	two	"B"	42	eleven (code)
"3"	33	three	"C"	43	twelve (code)
"4"	34	four	"D"	44	thirteen (code)
"5"	35	five	"E"	45	fourteen (code)
"6"	36	six	"F"	46	fifteen (code)
"7"	37	seven	"."	2E	dec.point (value)
"8"	38	eight	"-"	2D	minus sign(val.)

general

information: *Only for older devices without online- functionality:*

Transmission parameters are distinguished between online parameters and offline parameters, depending on their processing in the KFM – devices.

Online- parameters allow data transmission while the controller is in normal operating mode. In contrast, **offline-** parameters cannot be transmitted while the controller continues normal operation. So the controller has to be stopped by sending "10FE = 7708" (the display shows "ConF"). After the transmission the controller has to be switched-over to the normal operating mode by sending "10FF = 7708".

*(The parameter code is exemplary for channel 1. For example: 113A = travel time of actuator channel 1. For the other channels change the number at the second place to the true channel number, for example 123A = travel time of actuator channel 2).
Parameters are available depending on type and design.*

parameter for series 9..

read: (from KFM device)

status word 1 (8 Ascii-characters, code 1001)

char. 8	char. 7	char. 6	char. 5	char. 4	char. 3	char. 2	char. 1
---------	---------	---------	---------	---------	---------	---------	---------

Ascii- character 1..7: status measuring input 1 .. 7
 0 = error-free measurement; 1 = fault at the resp. input

status word 2 (0 - 40 Ascii-characters depending on existing binary inputs, code 1002)

char. 40	char. 39	char. 2	char. 1
----------	----------	----	----	----	----	---------	---------

Ascii-character 1..40: status binary input 1 .. 40
 0 = binary input deactivated; 1 = binary input activated

status word 3 (0 - 40 Ascii-characters depending on existing additional contacts, code 1005)

char. 40	char. 39	char. 2	char. 1
----------	----------	----	----	----	----	---------	---------

Ascii-character 1..40: status additional contact 1..40
 0 = contact deactivated; 1 = contact activated

write: (to KFM device)

control word 1 (2 Ascii-characters, code 1004)

character 2				character 1			
bit 4	bit 3	bit 2	bit 1	bit 8	bit 7	bit 6	bit 5

bit 1 .. 4: control bus-setpoint 1 .. 4
 0 = bus-setpoint deactivated, internal sepoint (SP) active
 1 = bus-setpoint active (SPB)

control word 2 (10 Ascii-characters, code 1005)

character 10				character 1			
bit 40	bit 39	bit 38	bit 37	bit 4	bit 3	bit 2	bit 1

bit 1 .. 40: control additional contact 1 .. 40, if the contact is configured to "BUS"
 0 = contact deactivated
 1 = contact activated

parameter for malfunction indicator type 821, 822

CODE (HEX)	parameter*	range
100F	status word binary input 1-16	0, 1

Logical organization of the hexadecimal status word with the resp. LEDs:

figure 7				figure 6				figure 5				figure 4				figure 3				figure 2				figure 1				figure 0			
4	3	2	1	8	7	6	5	12	11	10	9	16	15	14	13	4	3	2	1	8	7	6	5	12	11	10	9	16	15	14	13

figure 7..4 = status LED 1 to 16 (0 = LED off, 1 = LED active)

figure 3..0 = flashing status LED 1 to 16 (0 = LED constantly on, 1 = LED flashing)

example: LEDs 1,6,8,11,16 active (0001 1010 0100 1000),

LEDs 6,8,16 flashing (0000 1010 0000 1000)

=> status word 1 = "1A48 0A08" (as ascii-character string)**

parameter for tableau type 8219sbtm

CODE (HEX)	parameter*	range
0901	status word binary input 1-16 of I/O-unit 1	0, 1
0902	status word binary input 1-16 of I/O-unit 2	0, 1
0903	status word binary input 1-16 of I/O-unit 3	0, 1
0904	status word binary input 1-16 of I/O-unit 4	0, 1

Logical organization of the hexadecimal status word 1-4 with the resp. LEDs:

addr	addr,	figure 7				figure 6				figure 5				figure 4				figure 3				figure 2				figure 1				figure 0			
		4	3	2	1	8	7	6	5	12	11	10	9	16	15	14	13	4	3	2	1	8	7	6	5	12	11	10	9	16	15	14	13

addr double-digit address of the resp. I/O-unit (e.g. malfunction indicator address 04)

, separator (comma) between address and status word

figure 7..4 status LED 1 to 16 (0 = LED off, 1 = LED active)

figure 3..0 flashing status LED 1 to 16 (0 = LED constantly on, 1 = LED flashing)

example: LEDs 2,5,7,10,15 active (0010 0101 0010 0100),

LEDs 5,7,10 flashing (0000 0101 0010 0000)

=> status word 1 = "04, 2524 0520" (as ascii-character string)**

note: In case of an interruption between tableau and I/O-unit, the address 00 will be send.

* (Parameters are available depending on type and design.)

** Transmission as hexadecimal number, e.g. 1 (ASCII)= 31 (hex) , see also section "data format", page 2!

programming example in "C" (extract):

```

void send_data_frame( void)
{
int i;
char antwort=' ', z_buff[80];
unsigned char bcc;

printf( "\n\ndata ----> controller");
for ( i=0; i<=strlen( lst); i++ )           // send data - frame
{
if ( i==0 )
{
